H1: Something Awesome - Pitch

The main task for High Distinction is the Custom Project – focus on making sure you have a project at that standard before engaging in this task.

This task is all about showing your full potential. This task calls you to challenge yourself to achieve something awesome – giving you the scope to determine what that is.

Show us that you:

- Can plan, execute, and evaluate work that demonstrates extended knowledge, skills, and attributes at an exceptional level, showing fluency, originality, and integration of concepts – within the scope of an introductory programming unit and your prior experience.

Give us:

- A PDF document pitching your idea for this task.

We will check:

- What you have been capable of achieving.
- Assessment will take into consideration the following aspects:
    - Level of growth shown, and depth of programming knowledge and expertise shown
    - Personal connection - how it is your project, and not something generic or just presenting facts or data.
    - How well you present it - again, personal is better

Do the following:

1. Plan and conduct work to demonstrate what you can achieve - excellence in programming.

> **What could be awesome?**
>
> The main thing will be something personal - a thing that you want to achieve, take ownership of, and delve into. This is a very open-ended task as we want to give you scope so that you have the opportunity to shape this to be something meaningful to you and aligned with your interests.
>
> Here are some examples, each could be awesome if done correctly.
>
> - An amazing custom program, which demonstrates technical expertise well above the expectations for the custom project at a high distinction level.
> - Outstanding contributions in supporting others, reflecting on their challenges, and exploring associated research.
> - A project that combines aspects of this unit with things you have learnt in other units.
> - Learn, use, and compare a new programming language or paradigm.
> - Exploration of algorithms or more advanced data structures.
>
> You are strongly encouraged to discuss your ideas with the teaching staff. We can help extend and develop your ideas and work. The standards on this task will be high, so seeking feedback will help you ensure you are working at an appropriate level.

2. Copy and open the submission template.
3. Discuss your ideas with the teaching team in the workshops. Then, complete the H1 Pitch section, describing what you aim to achieve in completing this project.
4. **Upload** to OnTrack and **engage with feedback** to get this complete!

Remember, at the High Distinction level you should take full ownership of your submission. If you want feedback or advice, you must ask for it. Think of the teaching team as your colleagues, sounding boards with specific strengths and expertise rather than someone who should know what you need to do.
